

DATACASTLE ANALYTICS

ACTIONABLE INSIGHTS FOR INVESTIGATIONS AND COMPLIANCE

In today's increasingly mobile information economy, the boundaries of organizational networks have become highly amorphous. As a result, tracking digital data as it propagates across employee end-point devices almost impossible. Until now.

Datacastle Analytics is a groundbreaking smart data discovery solution. It reduces organizational risk by providing legal, HR, finance and compliance professionals tasked with conducting security or compliance investigations with actionable insights into how digital data travels across organizational networks.

**ACTIONABLE
INSIGHTS**

**FAST
ANSWERS**

**REDUCE
RISK**

GET ACTIONABLE RESULTS

Organizations rarely know what digital data exists and on which devices, which limits the scope and effectiveness of security and compliance investigations.

Datacastle Analytics gives you unprecedented access to actionable insights that reveal how digital data propagates across organizational networks

For the first time, you can trace the path of any digital data—text, video or image—as it propagates across end-point devices within your organization. You can use relationship graphs to identify which devices, whether laptop, tablet, smartphones or virtualized device in the cloud, share the same content.

You can also enforce key internal data security policies by identifying which users are moving digital content to cloud sync and share services.

FIND ANSWERS FASTER

Conducting confidential and sensitive security or compliance-related investigations is time and resource intensive and can be disruptive to the organizational workflow.

Datacastle Analytics increases the efficiency and accuracy of internal investigations

Datacastle Analytics gives you the power of analytics without a data scientist. And by bringing encoded end-point data into a big, cloud-based repository for

analysis, you can significantly accelerate time-to-insight. This allows you to complete investigations faster and more accurately using fewer resources.

REDUCE RISK

Many organizations in complex security and regulatory environments do not have the resources needed to investigate all reported security or compliance issues. This exposes them to considerable risk.

Datacastle Analytics improves your ability to respond quickly to security and compliance issues

Using Datacastle Analytics insights, you can quickly investigate all reported incidents that impact security or compliance without adding resources. At the same time, you can complete sensitive investigations with a high degree of confidentiality, accuracy and confidence while preserving employee privacy.

HOW IT WORKS

An agent is silently deployed onto employee endpoints across your organization. Data relating to content on each device is uploaded to a big, cloud-based repository at intervals you choose.

Using the web-based Datacastle Analytics reporting dashboard, you can access a broad range of insights that will help you conduct more investigations with a higher degree of confidence.

GET STARTED TODAY

Getting started with Datacastle Analytics is easy with features like Active Directory/LDAP integration, device trace information, and centralized policy management.

Contact us today to learn how your organization can take advantage of a smart data discovery solution to reduce organizational risk without adding more resources.

Datacastle Analytics offers a broad range of capabilities to assist the smart data discovery process:

Find a file: Locate any digital data where it exists on any endpoint within the organization

File origination: Identify the endpoint from which any digital data originated within the organization

Relationship mapping: Identify which digital data is shared across devices in the organization

File propagation: See how digital data has spread across the endpoints of the organization

File genealogy: Find files with a common subset of content, where file content first originated and where the most recently changed file with that given content is located

Device and content geolocation: Identify when a device was in a specific location and the content on the device at that time

Cloud file sync and share: Identify if unauthorized files have been moved into cloud file sync and share services like DropBox
